

ZORBIES™

RESONANCE-DAMPING PADS

clear off
resonance
blur

ZORBIES™ are like pieces picked up from the assembly line of Ensemble. The Swiss company with the uniquely comprehensive concept of integrating every possible element that can improve sound quality into its designs, applies them regularly, along with numerous other elements and constructional measures.

As a mixed hifi installation may consist of components whose construction and build quality are on the light side and therefore easily excited by vibrations of mechanical origin or through the impact of sound waves, attaching a few ZORBIES can noticeably reduce the sound-degrading effects of resonance.

The self-adhesive ZORBIES can improve the isolation of equipment feet, damp the vibration of a transformer or motor, reduce the potential ringing of thin metal parts, or can be put on top of reservoir capacitors (in power supplies, etc.).
